

The Major bond letter

#26. Bring it on

With 2022 likely to be the worst year in nearly half a century for the bond markets, bond investors want to bring on 2023. Clients ask, "When will it be time to buy bonds?" Often the question is framed around potential catalysts in the data, but at its core what is being asked is quite simple: tell us when, not why.

We obviously don't have a crystal ball. But we do have a framework that helps us understand the longer-run drivers of the bond market. Markets move first, reasons follow. Bonds normally move in advance of the economic data and policy decisions, especially around turning points. This means the causality is not from the economic data and central banks; it is reversed: markets, central banks, then data.

We think four aspects of valuations are worthy of more attention to help us answer the question about timing that investors are asking.

First, the forwards – the market's estimate of where rates and yields will be in the future – are likely to pre-empt a change in policy direction. True, in 2022 the market was consistently caught off guard by inflation surprises. Inflation prints were often on the upside of consensus until the October CPI release last week, when there was a significant downside surprise. Markets are discounting mechanisms. Rapidly pricing in all available information is what they are supposed to do. In more normal times, we would expect markets to pre-empt central banks.

Forwards are telling us a lot is in the price. For example, the upper bound of the Fed funds rate is now at 4.0%, but the forwards recently went as high as 5.0% for the March 2023 projection. Inflation-linked Treasuries had put the 12-month real yield at around 2.0% for the 1-3 year tenors only three weeks ago. As a gauge of how restrictive policy has become, this is almost double the level reached in the 2018-19 cycle. It is also significantly above the Fed's own measure of the longer-run equilibrium of 50bp, given a return to 2.0% inflation, the central bank's target level.

Sticky inflation – the type that does not fall back to central bank targets – presents the main risk to lower bond yields. There were policy mistakes in the 1970s, and Fed officials are referencing this period as a reason to maintain their hawkish bias. But we should consider the extent of rate hikes to date, how many are yet to come, the sharp tightening of financial conditions, and the growing likelihood of recession. Considering all these factors gives policy a decent chance of working by bringing inflation lower.

A second timing consideration is the appeal of cash versus bonds. Rising rates make it intuitively appealing to park cash in short-dated deposits or money market funds. Investing today for six months at 4-5%, for example, is all very well if it is possible to invest at the same or higher rate in May 2023. But what about the opportunity cost? If at any stage the investor thinks the rate cycle will turn, it would be better to hold longer-maturity bonds. If everyone tries to make the switch simultaneously, yields are likely to fall quickly. Practically speaking, it may not be so easy to switch into bonds without some expense; this is especially the case with deposits.

A third clue as to when to buy bonds is related to the fact that bond markets are global. Events in the UK recently had an impact on global bonds whilst central banks in Canada and Australia, along with many emerging market economies, are likely to be ahead of the Fed in this cycle.

Anyway, we think US yields are relatively high compared with the equivalents in Europe and China. Given that the US appears to be ahead in the tightening cycle compared with these two regions, we think the most likely way for the already wide spreads to revert to historical levels is through US yields falling, rather than those in the other regions rising. Related to this, with real yields recently approaching 2.0%, they are close to trend GDP, and offer significantly less risk.

As a fourth criterion, related to the point about forwards and the real yield, we should compare bonds with equities. We can see what a bad year it has been for both bonds and equities in the chart. Total returns on US Treasuries, the bond market that matters most in global fixed income, are in fact the worst on record; the aggregate Treasury index is down 13% and long bonds 33%.

Figure 1. Worst year for bonds on record

Note: Indices used are Bloomberg US Treasury 20+ Year Total Return Index and S&P 500 for 1977-2021 and 2022 YTD
 Source: Bloomberg, HSBC

Our histogram (Figure 1) uses data for the last 45 years and compares long bonds with equities. We chose long bonds because their high duration makes them more directly comparable with the equity asset class. The y-axis represents the frequency of observations whilst the x-axis shows buckets of total returns. So, year-to-date, the 2022 returns for long bonds are in the -40% to -30% bucket, and the number of observations is one. Equities are to the right, with four observations.

We know that there is more than one way to present this data. A series of accumulated returns, using logarithms to capture exponential growth over time, show bonds beating equities for most of the last 20 years. Until this year, that is.

Whilst investors are mindful that the past can be a poor guide to the future, we can at least look ahead to next year reasonably confident in the knowledge that there are aspects of valuations in place that may make it less likely that this year's terrible performance will be repeated in 2023.

As we head into the new year, we think these four aspects of valuations will be key in the decision about when it will be the right time to buy bonds.

Disclosure appendix

The following analyst(s), who is(are) primarily responsible for this document, certifies(y) that the opinion(s), views or forecasts expressed herein accurately reflect their personal view(s) and that no part of their compensation was, is or will be directly or indirectly related to the specific recommendation(s) or views contained in this research report: Steven Major, CFA

This document has been issued by the Research Department of HSBC.

HSBC and its affiliates will from time to time sell to and buy from customers the securities/instruments, both equity and debt (including derivatives) of companies covered in HSBC Research on a principal or agency basis or act as a market maker or liquidity provider in the securities/instruments mentioned in this report.

Analysts, economists, and strategists are paid in part by reference to the profitability of HSBC which includes investment banking, sales & trading, and principal trading revenues.

Whether, or in what time frame, an update of this analysis will be published is not determined in advance.

For disclosures in respect of any company mentioned in this report, please see the most recently published report on that company available at www.hsbcnet.com/research.

Additional disclosures

- 1 This report is dated as at 14 November 2022.
- 2 All market data included in this report are dated as at close 10 November 2022, unless a different date and/or a specific time of day is indicated in the report.
- 3 HSBC has procedures in place to identify and manage any potential conflicts of interest that arise in connection with its Research business. HSBC's analysts and its other staff who are involved in the preparation and dissemination of Research operate and have a management reporting line independent of HSBC's Investment Banking business. Information Barrier procedures are in place between the Investment Banking, Principal Trading, and Research businesses to ensure that any confidential and/or price sensitive information is handled in an appropriate manner.
- 4 You are not permitted to use, for reference, any data in this document for the purpose of (i) determining the interest payable, or other sums due, under loan agreements or under other financial contracts or instruments, (ii) determining the price at which a financial instrument may be bought or sold or traded or redeemed, or the value of a financial instrument, and/or (iii) measuring the performance of a financial instrument or of an investment fund.
